Summary

There is an amount of 1 bln sites in the world and it's number continues to grow up to 5-7% annually. Despite that, only 3% of them use share buttons - only 30 mln sites.

More than 3 bln people use social networks, 10% among them do it quite actively. The most popular users, in Instagram, for ex, have already understood, how to earn money on that.

Sharpay will help all the social active users to monetize their popularity by earning crypto currency.

Sharpay is a unique technological and very simple share button. Sites put the button under any content instead of other old sharing buttons and users get rewards for sharing. The system has fraud protection, bot defense with audience targeting possibility based on CPV (cost per visit) payments.

The innovation of **Sharpay** — blockchain profit for sharing with tokens and multisharing — sharing in several networks with one click. This is a unique project, that has simultanioulsy the two possibilities. The technology is protected by the Eurasian international patent priority.

Sharpay — is a new SMM instrument for increasing traffic, conversions, sessions and sales with less spends.

Spreading the **Sharpay** technology will increase the aggregated sharing from 3% to 10% in the world. **Sharpay** plans to get 50% of that growth that is equal to 35% of international market in general and corresponds to 35 mln sites.

Sharpay will quarterly allocate 90% of the proceeds to ensure the redemption of tokens from their holders (investors and users). The program starts according to the results of the 3rd quarter of 2018. The price of the buyback is based on the nominal price of a token at 0.00003 ETH what is nearly \$0.01 at the moment of the offical launch in November, 2017. This will ensure stable support for the value of the token at a level not lower than the nominal.

Sharpay's tokens are initially released on Ethereum according to the ERC20 standard, the blockchain is used as a financial registry. At the next stage of development of **Sharpay**, it is planned to develop and launch an

independent decentralized blockchain system (BitShares fork with a POS-basis), followed by the migration of tokens-the blockchain will be used for issuing, distributing tokens between sites and users for social activity, and storing the information.

Starting with the second stage, the profit from the blockchain will gain not only users, but also the sites for installing the buttons. Starting from the second stage the profit from blockchain will gain not only the users, but also the sites for installed buttons.

The price of the **Sharpay** token has the potential to grow at least 4 times, considering the planned turnover for the third year of the project development, reaching \$160 million.

Market

People have always been sharing news, thoughts and ideas. A switch to online communication has significantly increased the number of people engaged in information exchange process as well as the volume of content being distributed. Today, any Internet project by all means seeks to extend its presence in the field of blogs, social media and forums, because it's a powerful source of potential traffic. Visitor flow is money, reputation and business growth. Posting content in the social space is an integral part of search engine optimization. The number of platforms in the Internet engaged in social communications through information sharing increases every day. It's already hard to imagine our life without this tool. We communicate, get acquainted with each other, promote our business, read news by sharing.

Content sharing from websites to user pages in the social media appeared more than 10 years ago when Facebook, Twitter, VKontakte etc. became popular all over the world. Initially based on open social media API, this technology was at the same time caught up by independent start-up companies making it popular through aggregation of API of various social media into one and the same unit of share buttons with additional settings (customization) for independent website developers and users. After a while, **AddThis.com**, **ShareThis.com**, **AddToAny.com**, **Pluso.ru** became the most known and successful share aggregators in terms of its market share position.

Today it's about 1 billion websites in the world and this number has been increasing by 5-7% per year in average. Share aggregators' buttons can be found only on no more than 3% (30 million) of websites from this amount. The competitors have the following shares in the market (analytics by **Sharpay**):

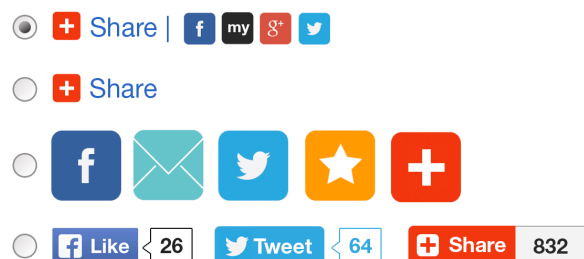

As reported by Zenith Optimedia, the amount spent on SMM (social media marketing) all over the world will grow by 72% by 2019 — up to \$50 billion — and will keep growing.

Subject

It's been more than ten years since social media, share buttons and aggregators appeared, and traditional sharing technology has not actually changed. One has to agree that this is strange for the fast-growing market of Internet solutions.

Traditional sharing: sharing action repeated for each new social media

Why hasn't traditional sharing been developing? Because IT-companies had no economical driver to work in this direction — monetizing methods have been limited for these technologies. The first blockchain-based technologies may give a powerful impetus to the development of Internet advertisement through sharing.

Sharpay Solution

Sharpay is a share button of the next generation, which allows for one-click distribution of the content in social media with targeting and reward for click-through. As opposed to traditional analogues, **Sharpay** provides for multisharing of information, i.e. it makes it possible for users to one-click post the content on their pages in multiple social media at a time. Information posting becomes more convenient; moreover, after sharing each user gets blockchain-based tokens.

Sharpay is a new simple hi-tech blockchain-based SMM-tool for websites with embedded economic model of process incitement. **Sharpay** button extends traditional digital marketing battery and gives new possibilities for digital content, goods and services promotion. **Sharpay** ensures effective promotion of content in the Internet with targeting of viewers, rewards for click-through of the visitors corresponding to the established parameters and anti-cheat system.

Websites using **Sharpay** will significantly increase traffic and sales conversion. Users clicking **Sharpay** buttons and distributing websites' content will get a fair payment for being active in social media and for the click-throughs on the posted links by their subscribers: the more subscribers and click-throughs — the higher compensation gained by the user who shared the link.

Websites distributing content are interested in activeness of popular users who sometimes have millions of subscribers, but their interaction is often spontaneous (such as in Instagram). **Sharpay** provides the market with the new instrument, which makes counter-activity systematic. End users are essentially the main beneficiaries of **Sharpay**.

Sharpay as it is, makes the market generally better. It is easier now for various economic agents to find each other and to communicate, while information on good products and services may now be distributed faster.

With all the above-listed multiplied by technological leap due to blockchain popularization and tokenization of the old technologies, the window for revolutionary possibilities for creation, development and success of **Sharpay** project is opened.

How the button looks like

The sharpay button can look like anything, for example, like on this page, or it can be customized for the design of the site. The sharpay button can be of any color and there can be the logos of any priority social networks. The main feature of the button is the code, which is activated when you click on the button. If the options we're offering are not enough, fine, we can use your design and match it with our code.

Now Facebook, Twitter, LinkedIn, VK, Reddit, Telegram, Tumblr are already connected to the multisharing of the working version of the sharpay button. You can also copy a direct unique link and share it yourself on forums, blogs and in comments.

We are continuing to work on connecting new social networks, like WeChat, Weibo, QQ, G +, Snapchat, Viber, LiveJournal and others.

Sharpay Mission and Formula

The mission of **Sharpay** is to provide both websites and users of social media with the new, mutually beneficial, convenient, automated instrument for the promotion of content and goods of electronic commerce by fulfilling the demand of the websites in the increase of the content (information and goods) distribution conversions and that of the users — in easy multisharing process itself and monetization benefits due to the distribution of the content being promoted, i.e. gaining digital tokens.

*You share — we pay.
Sharing is the new mining.
Get your **Sharpay!***

Multisharing + Its stimulation by tokens = increase in conversion of websites' content distribution in social media, websites' traffic and internal KPI growing (number of active users, views, registrations, sales etc.)
+ Convenience and possibility of gaining tokens for the users (digital currency, crypto-currency).

Technology description

Sharpay project system is based on the synthesis of blockchain technology designed for system transparency and economic incitement of content promotion by means of tokens and multiaggregated API of the most of the leading world-wide social media and messengers (Facebook, Twitter, VKontakte etc.) designed for content distribution (multisharing).

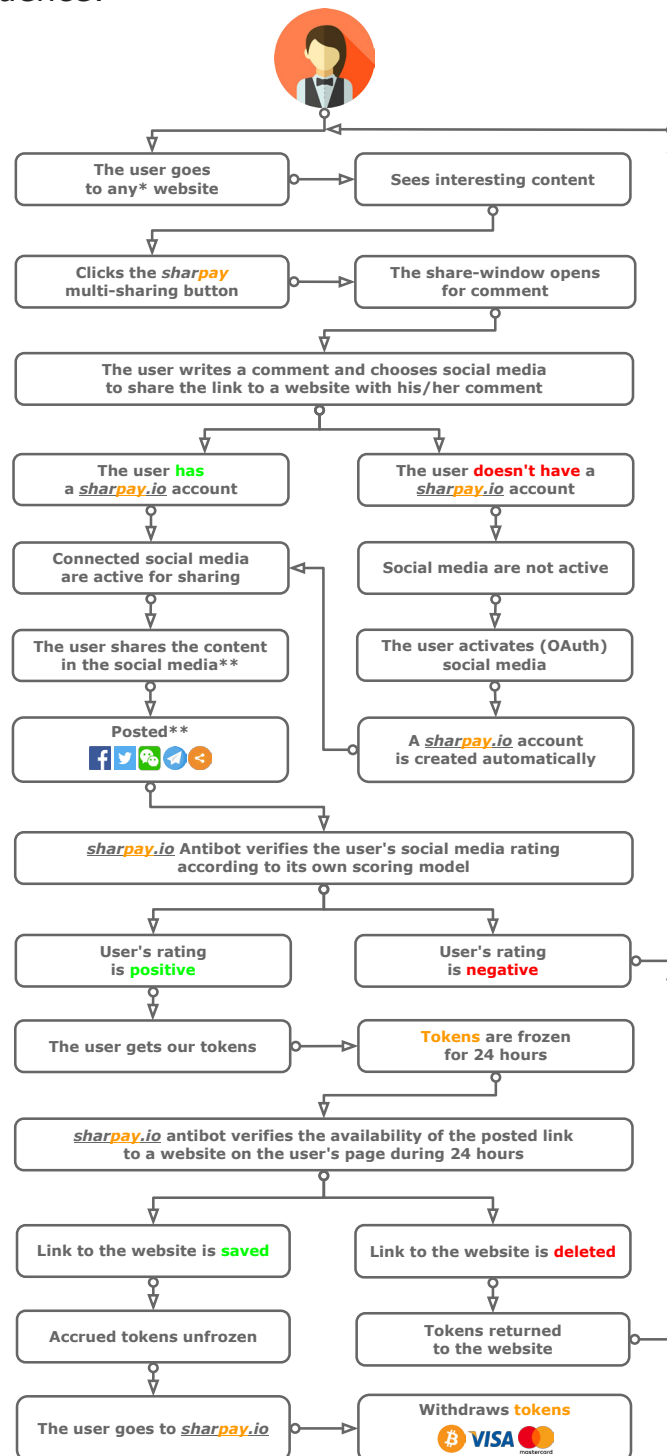

System Functioning Model

- Step 1.** Website company/owner buys **Sharpay** token package, for example, 100 tokens (for \$1), and identifies targeting — who will be charged with tokens for sharing/multisharing and for which click-throughs.
- Step 2.** Users start to share content on their pages in social media, forums, blogs, and messengers.
- Step 3.** **Sharpay** user account is automatically created after the first time the user shares the content through **Sharpay** button upon his/her agreement. Every user gets his/her rating within the system by means of Sharpay scoring system (depending on the number of friends, quality of subscribers, user activeness etc.). Tokens are charged depending on the rating and the number of further click-throughs on the link posted by targeted visitors. There are four types of rating provided for in the basic solution (zero, low, middle, high).
- Step 4.** Tokens are charged to the users immediately after sharing (if website charges tokens not only for click-throughs but for sharing as well) and are put on hold for 24 hours. Moreover, the user is charged with tokens for click-throughs on the link distributed in accordance with targeting parameters established by the website.
- Step 5.** **Sharpay** automatically checks the availability of shared content on the pages of users (for it not to be deleted) within 24 hours, counts click-throughs, checks quality of visitors.
- Step 6.** In case of positive check result (content is available in social media, click-throughs are in accord with quality), award is precisely calculated and tokens are unblocked. In case the result

is negative, tokens are returned to the website account.

Schematically, system functioning algorithm may be displayed as the following sequence:

* The user goes to any website; sees interesting content — the Internet user's visit to any website, which installed our Sharpay multisharing button instead of all conventional share-buttons

** The user shares the content in the social media — the user posted a link to interesting content on his/her social media pages (one or multiple to choose)

Owners of **Sharpay** tokens may sell them on exchanges or offer them for mandatory repurchase by **Sharpay** at the price established by repurchase programme.

Possibility of conversion of **Sharpay** tokens into another crypto-currencies or currencies will depend upon the level of exchange market development.

The user will have a scoring range for each social media, therefore, the amount of tokens charged for one multisharing will depend on his/her total scoring range and correspondence of visitors clicking the link to the targeting established.

Example 1: if the user distributes content within three social media in one click, he/she is charged with 3 tokens, if within more — depends on scoring for each social media. For example, 2 tokens for each FB and TW and 1 token for VK, 5 tokens in total.

Example 2: let's say the website got 28 shares for 100 tokens purchased. 15 of them are qualitative (i.e. qualitative to the minimum for 1 token) and 13 are of higher class — of high quality (middle and high).

Thus, the value of one token is equal to the value of one minimally effective (qualitative) share (hereinafter, minimal effective share).

Website may gain 10,000 shares for 100 tokens, but there will be no more than 100 effective (paid-for) ones among them.

1 minimal effective share = 1 **Sharpay** token = \$0.01

Sharpay is being updated at present. In basic version of the project implementation, tokens are only charged for sharing. In updated one, tokens will be charged both for sharing/ multisharing and click-throughs, making the process of checking of the availability of shared content on user pages unnecessary. In updated version, website will always have a possibility to pay both for sharing/ multisharing and click-throughs at a time or for click-throughs or sharing/ multisharing separately.

User who shares link to the content will have tokens charged in accordance with three indices combined:

- number of click-throughs,
- targeting (who shared),
- targeting (who clicked the link).

Technological features

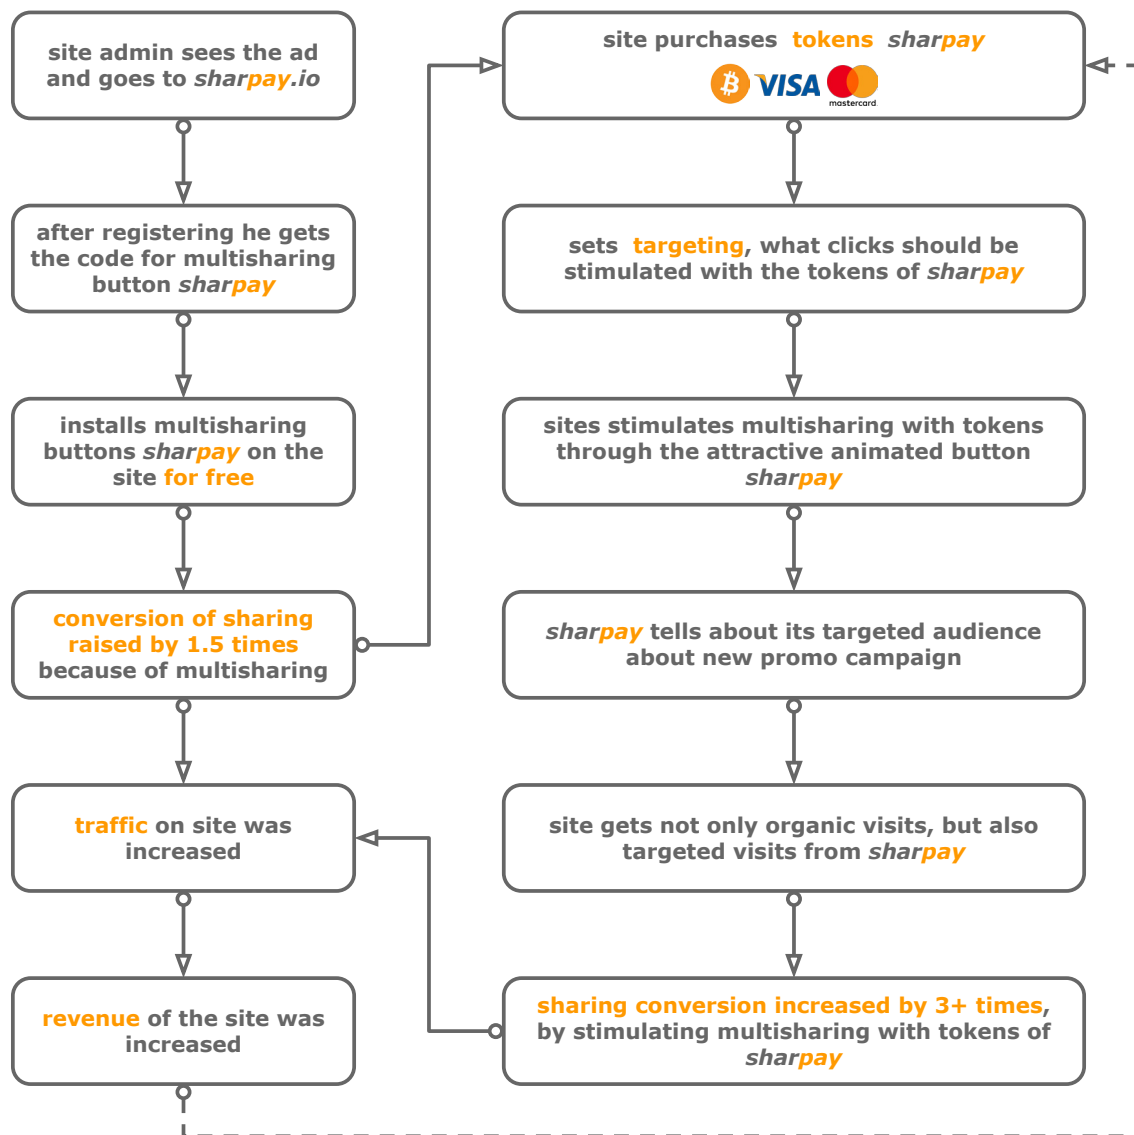

To optimize the work of the **Sharpay** project, the system has a number of technological features:

- **easy integration:** **Sharpay** multisharing buttons can be easily integrated into any Internet websites that are open to the integration of a third-party API, which means that hundreds of thousands and millions of websites can install and activate **Sharpay** buttons in less than 30 minutes
- **built-in targeting:** websites that have installed **Sharpay** buttons will be able to target users — both sharing the content and following links — to optimize the amount of payments (accrual to users of tokens) and fair charging of tokens, for example, only for goes that correspond the necessary criteria
- **«Social capital»:** users «sharing» content through the Sharpay buttons, will be automatically evaluated and ranked within the Sharpay system, depending on the level of their activity in social media (number of friends / subscribers, the number of publications/reposts, etc.), which in turn will affect the amount of reward charged to each particular user, reliably protecting websites from bots, but providing an opportunity for popular users to receive decent high reward.
- **protection from fraud:** to avoid abuse, the system has a mechanism to protect against bots and advertising fraud, limiting the number and size of multisharing paid per the day / week / month — will effectively counter the fans of easy money
- **ease-to-use:** the basic user, in order to start «multisharing» content using the **Sharpay** buttons installed on any different websites, does not need to learn anything new and immerse himself in the world of blockchain, tokens and crypto-technologies — at the first stage, the user makes familiar actions to spread the interesting content (same as with old sharing buttons), with the only difference that due to the appearance of multisharing, now it's easier and faster, plus, the user will see his/her growing balance of tokens in the system, which in the future, at a conscious transition to the next stage of cooperation with Sharpay system, will give the user the opportunity to receive a personal private key and access to the balance, to transfer tokens to cryptocurrency exchange and/or withdraw fiat.

The principle of operation, installation, convenience for websites

To successfully integrate and use the **Sharpay** multisharing buttons, websites need just a few clicks to get the button code with a personal unique identifier, set this code on the pages of their website, removing all old-generation button codes of the usual sharing. After that, the button is ready for use by users (site visitors) for content distribution and promotion.

* Clicked the personal account in **sharpay.io** — all actions in the personal account in **sharpay.io** are carried out by the site owner or website administrator (manager), if he has appropriate instructions or authority.

Multisharing, user convenience

Users (site visitors), as they get acquainted with the website content, are invited to «share» interesting content from the website to their pages in social media by clicking on the **Sharpay** multisharing button, which in appearance and customization, at first glance, does not differ from the usual buttons of old generation sharing aggregates.

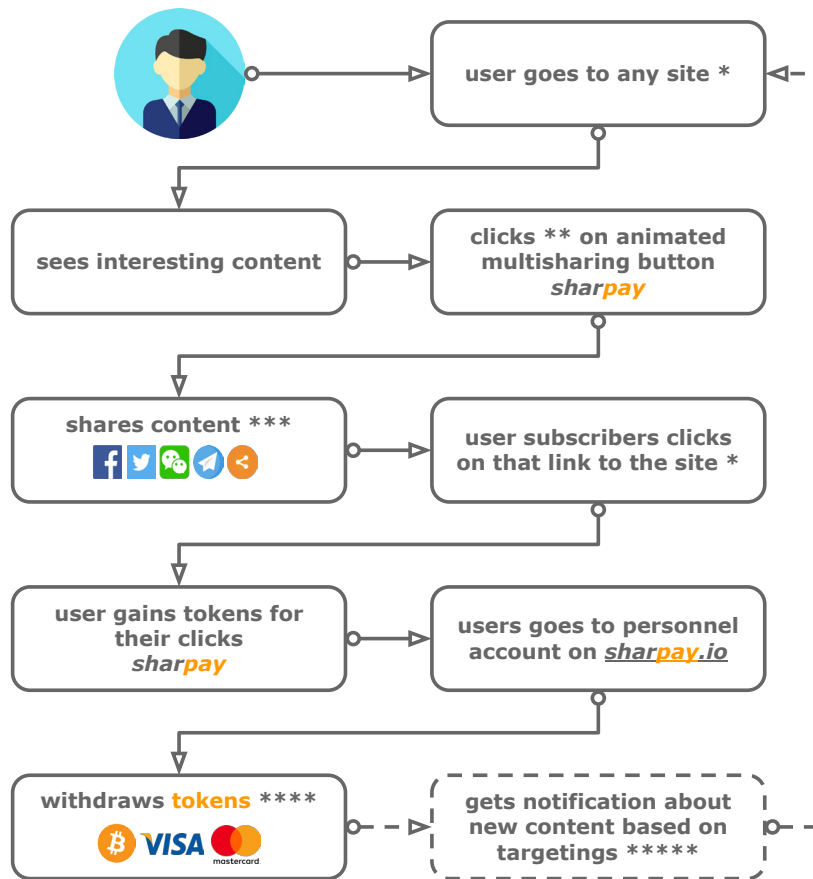

(In one of the button customizing options, it is possible to display the digital balance of tokens directly on the button, with a crypto currency Token Sale, which will allow users to show additional interest in button activation and content distribution).

Being interested in distributing interesting content, after activating the **Sharpay** button, in the usual pop-up window the user is asked to write an accompanying comment on the «shared» content and choose the social media where this content will be promoted.

The peculiarity and convenience of multisharing is that a user can tick one to multiple social media to his/her choice, where content with an accompanying comment will be sent after clicking on the «Send» button.

It should be noted that at first activation of any of the social media in this process, a personal account with an electronic wallet inside **Sharpay** is automatically created for the user, to which the user subsequently has access at any time, without the need to enter a login / password, and by means of oauth-authorization when the project is transitioned to a blockchain, the user will receive private keys from his/her wallet).

* The user goes to any site – the user’s redirection online to any site that has already installed the sharpay multisharing button, instead of all the usual share-buttons

** Clicks the animated sharpay button – at the time of the first sharing, the user automatically creates a personal cabinet in sharpay

*** Shares content – the user published a link to interesting content on his/her pages in social networks, in one or more at his/her discretion

**** Withdraws tokens – through a quarterly sharpay program of buying tokens, or through crypto-exchanges

***** Receive notification of a new content according to the targeting – sharpay sends to users, who meet specified criteria, notifications about the possibility to share new interesting content that sites promote for tokens

Economic model of multisharing stimulation

An important element of the whole system is the built-in economic model for stimulating content distribution. After the user a) decides to «share» interesting content, b) writes his/her comment on it, c) chooses, at his/her discretion and interesting to the audience, the social media to share d) presses the button «Send» — the user will see that tokens for the distribution of content and following links accrued on the balance of his/her personal online wallet in **Sharpay**.

All this, of course, not only simplifies the distribution of website content in social media (option — multisharing), forums and instant messengers, but, by receiving rewards in tokens of the system, also encourages users to repeat multisharing in the future in order to «earn».

Comparison with competitors

In comparison with its predecessors, aggregators of the usual old-generation sharing, **Sharpay** has the following advantages (*own Sharpay analysis*):

	Sharing	NEW: multisharing	NEW: sharing with profit	NEW: Blockchain usage
sharpay 	+	+	+	+
 AddThis	+	-	-	-
 ShareThis	+	+/-	-	-
 AddToAny	+	-	-	-
 Pluso	+	-	-	-

Sharpay business model

The basis of the economic model of **Sharpay** is the following:

- **CTR** is the ratio of users who click the Sharpay content sharing buttons with blockchain profit
- **Number of websites and applications with buttons** is the total number of websites and mobile applications with Sharpay buttons installed
- **Number of websites that buy Sharpay tokens** is the percentage of websites and mobile applications from the total number of those which installed buttons that use Sharpay tokens to encourage content distribution
- **Average traffic on websites/per month** is the average traffic size on each website with Sharpay buttons (Sharpay's own analytics based on open data on monthly traffic on the Internet on different websites)
- **The ratio of verified users receiving Sharpay tokens** is the percentage of users distributing content through the Sharpay buttons that passed the internal anti-bot filter of the Sharpay system
- **CPV (cost per visit) for a website** is the minimum cost of 1 visit for a website (how much the website gives to users in USD equivalent) corresponds to the market value of 1 Sharpay token, starting from the nominal value at the start of the system
- **CPV (cost per visit) for a verified user who receives Sharpay tokens** is the minimum cost of 1 click / following for the user (how much the user receives from websites in USD equivalent) depends on the Sharpay fee, in relation to the cost of the click cost for the website
- **Click efficiency ratio** is an increase in the cost of a click, in accordance with targeting, is an indicator of the relevance of the audience, following the distributed links to the quality parameters of such an audience set by websites than better the quality of the audience into the targeting of websites — the more the website gives to users, who have distributed links.
- **User activity ratio** (the amount of paid sharing per user a day) is the Sharpay antispam filter: how many links per day can the user

distribute (total) with the help of Sharpay buttons, the followings for which will be paid to the user by the websites

- **Sharpay fee** is the percentage of the actual turnover of the tokens inside Sharpay retained as a reward

Development scenarios

Following are 3 models of **Sharpay** development are presented, depending on the Token Sale results:

Development model, Token Sale no less than \$3 million	2018	2019	2020
CTR (click-through rate)	1%	1%	1%
Number of websites and applications with buttons	31 000	59 000	115 000
Number of websites buying Sharpay tokens	7%	12%	15%
Average traffic on websites / per month	100 000	100 000	100 000
Ratio of verified users receiving Sharpay tokens	10%	15%	20%
CPV (cost per visit) for a website	\$0.01	\$0.01	\$0.01
CPV (cost per visit) for a verified user receiving Sharpay tokens	\$0.009	\$0.009	\$0.009
Number of months in a year	12	12	12
Ratio of the click efficiency (average cost of click, in accordance with targeting)	3	3	3
User activity ratio (the amount of paid sharing per user a day)	5	5	5
Sharpay fee	10%	10%	10%

Development model, Token Sale \$10 million	2018	2019	2020
CTR (click-through rate)	1%	1%	1%
Number of websites and applications with buttons	46 000	103 000	201 000
Number of websites buying Sharpay tokens	7%	12%	15%
Average traffic on websites / per month	100 000	100 000	100 000
Ratio of verified users receiving Sharpay tokens	10%	15%	20%
CPV (cost per visit) for a website	\$0.01	\$0.01	\$0.01
CPV (cost per visit) for a verified user receiving Sharpay tokens	\$0.009	\$0.009	\$0.009
Number of months in a year	12	12	12
Ratio of the click efficiency (average cost of click, in accordance with targeting)	3	3	3
User activity ratio (the amount of paid sharing per user a day)	5	5	5
Sharpay fee	10%	10%	10%

Development model, Token Sale \$15 million	2018	2019	2020
CTR (click-through rate)	1%	1%	1%
Number of websites and applications with buttons	58 000	124 000	243 000
Number of websites buying Sharpay tokens	7%	12%	15%
Average traffic on websites / per month	100 000	100 000	100 000
Ratio of verified users receiving Sharpay tokens	10%	15%	20%
CPV (cost per visit) for a website	\$0.01	\$0.01	\$0.01
CPV (cost per visit) for a verified user receiving Sharpay tokens	\$0.009	\$0.009	\$0.009
Number of months in a year	12	12	12
Ratio of the click efficiency (average cost of click, in accordance with targeting)	3	3	3
User activity ratio (the amount of paid sharing per user a day)	5	5	5
Sharpay fee	10%	10%	10%

Financial plan

The main source of **Sharpay** monetization is the commission from the turnover of tokens in the system. The calculations in this Financial Plan are carried out according to the plan of revenue received from commission.

Note that in future it is planned to activate additional ways of monetization, namely, provision of premium services and advertising placement in multisharing windows.

The economic model of **Sharpay** is based on the following formulas:

- **Traffic (Sharpay button impressions) per year** = Number of websites and applications with Sharpay buttons × Average traffic on websites / per month × Number of months in the year
- **Number of Sharpay button impressions on websites that buy tokens** = Number of traffic (Sharpay button impressions) per year × Number of websites that buy Sharpay tokens
- **Number of user clicks on Sharpay buttons (number of sharings)** = Number of Sharpay button impressions on websites that buy tokens × CTR (click-through rate) × User Activity Ratio (number of paid user sharing per day) × Number of months in the year
- **Number of verified user clicks on Sharpay buttons (number of paid sharings)** = Number of user clicks on Sharpay buttons (number of sharings) × Verified users receiving Sharpay tokens ratio
- **Cost of visits for websites** = The number of clicks of verified users on the Sharpay buttons (the number of paid sharings) × CPV (cost per visit) × Ratio of click efficiency
- **Sharpay fee** = CPV (cost per visit) × Sharpay fee size
- **TOTAL, Sharpay earnings = Sharpay fee**

Tables below show the indicators of the **Sharpay** economic model planned to be achieved depending on the implemented scenario of the project development.

Monetization model, Token Sale \$3 million	2018	2019	2020
Number of traffic (Sharpay button impressions), billions per year	37.2	70.8	138
Number of Sharpay button impressions on websites, buying tokens, billions	2.604	8.496	20.7
The number of user clicks on Sharpay buttons (the number of sharings), billions	1.562	5.098	12.42
The number of verified user clicks on Sharpay buttons (the number of paid sharings), billions	0.156	0.765	2.484
Cost of visits for websites, millions	4.687	22.939	74.520
Sharpay Comission, millions	0.469	2.294	7.452

Monetization model, Token Sale \$10 million	2018	2019	2020
Number of traffic (Sharpay button impressions), billions per year	55.2	123.6	241.2
Number of Sharpay button impressions on websites, buying tokens, billions	3.864	14.832	36.18
The number of user clicks on Sharpay buttons (the number of sharings), billions	2.318	8.899	21.708
The number of verified user clicks on Sharpay buttons (the number of paid sharings), billions	0.232	1.335	4.342
Cost of visits for websites, millions of \$	6.955	40.046	130.248
Sharpay Comission, millions of \$	0.696	4.005	13.025

Monetization model, Token Sale \$15 million	2018	2019	2020
Number of traffic (Sharpay button impressions), billions per year	69.6	148.8	291.6
Number of Sharpay button impressions on websites, buying tokens, billions	4.872	17.856	43.74
The number of user clicks on Sharpay buttons (the number of sharings), billions	2.923	10.713	26.244
The number of verified user clicks on Sharpay buttons (the number of paid sharings), billions	0.292	1.607	5.249
Cost of visits for websites, millions of \$	8.770	48.211	157.464
Sharpay Comission, millions of \$	0.877	4.821	15.746

Structure of expenditures

In the next 3 years, the financial assets raised in the ongoing Token Sale campaign will be directed to the implementation of the entire set of tasks in order to achieve the goals stipulated by this document.

Depending on the amount of the funds raised, Sharpay suggests 3 development scenarios.

Scenario 1, Token Sale \$3 million

Project development plan for 3 years:

- development of basic functions
- development of buttons for mobile applications
- promotion and sales in Europe and Asia
- transposing international PCT priority into national patenting phases

Scenario 2, Token Sale \$10 million

Project development plan for 3 years:

- development of basic functions
- development of buttons for mobile applications
- promotion and sales in Europe and Asia
- transposing international PCT priority into national patenting phases
- launch of an independent decentralized blockchain (fork BitShares)
- migration of tokens to blockchain
- ensuring project compliance with the requirements of national regulatory authorities
- entering the markets of the USA, Canada and Latin America
- obtaining of national patents

Scenario 3, Token Sale \$15 million

Project development plan for 3 years:

- development of basic functions
- development of buttons for mobile applications
- promotion and sales in Europe and Asia
- transposing international PCT priority into national patenting phases
- launch of an independent decentralized blockchain (fork BitShares)
- migration of tokens to blockchain
- ensuring project compliance with the requirements of national regulatory authorities
- entering the markets of the USA, Canada and Latin America
- obtaining of national patents
- development and implementation of websites and online stores
affiliate programs for the exchange of goods and services for the tokens of Sharpay users
- project scaling, entering all the most important world markets, active marketing and sales

Strategic plans

Over the next 3 years, **Sharpay** plans to:

- create a partnership base of 200–500 thousand commercially viable websites and applications that had **Sharpay** multisharing buttons installed (depending on the development scenario)
- have up to 50 million users registered (based on the planned number of websites with buttons and their average monthly traffic)

Sharpay expects that the trend for the growth of blockchain technologies popularity will become a powerful driver for the creation of the sharing market with blockchain profit. Moreover, new websites and mobile applications that previously did not use any sharing aggregators at all will be virally involved in the process. This should have an additional impact; actual penetration of **Sharpay** can be many times higher than the claimed one.

Today, old-generation buttons for aggregated sharing are installed only on 30–50 million websites, which is about 3–5% of the total number of websites on the Internet. All of them do not use economic stimulation of content distribution.

According to our forecasts, the distribution of **Sharpay** multisharing technology with lockchain profit payment will increase the penetration of aggregated sharing buttons by no less than up to 10%. **Sharpay** can drive the multiple market growth. Based on the current market capacity assessment, **Sharpay** plans to occupy at least 50% of its growth in 5–7 years. This is equivalent to 35% of the aggregated sharing market in general and is equal to 35 million websites in absolute terms.

Not long ago, **AddThis.com**, one of the most well-known world aggregators of the obsolete sharing, was taken over by **Oracle** with an appraisal of about \$200 million. The future **Sharpay** capitalization from the point of view of the occupied share of the sharing market should surpass the AddThis.com performance by at least 2 times. Thus, the market valuation of **Sharpay** may reach about \$400 million in 3 years, and \$1 billion in 5 years, as it continues to expand. Same benchmarks are also confirmed in terms of the planned number of partner websites in the system for the same period, their average need for Sharpay tokens to pay for promotion and, consequently, the market value of Sharpay tokens.

Risks and opportunities

Please note that we adequately assess the market potential, our risks, and the opportunities that our entry will provide for the existing established competitors.

Calculations for all of our planned and financial indicators are made taking into account and with allowance for these risks!

The launch of Sharpay can be a driver for the existing market players and their tuning in to the spirit of the times. However, Sharpay is clearly in a winning position against them, thanks to the time difference, as well as the availability of a ready-to-use technology that Sharpay team was the first to apply to this market.

Moreover, we enjoy the following advantages:

1. Not only has **Sharpay** implemented a sharing button with blockchain profit, but also has ALREADY activated the international patent protection procedure, which means a priority in the future in terms of providing such services.
2. Any potential competitor needs to restructure their development model to enter a new market, which is long, difficult, and expensive.

"You snooze, you don't win. Early bird gets the worm"

Sharpay operates within the «**blue ocean**» concept, which is conscious avoiding price competition in traditional low-margin markets by seeking new free niches and gaining technological leadership there. This approach is designed to ensure the company's entry to a new market and the creation of a new demand. The multisharing and blockchain profit for sharing are basic innovations in the **Sharpay's** strategy. Currently **Sharpay** is the only company in the world market that implements both these factors on a technological level at a time.

Marketing and sales

The successful market penetration of sharing buttons with blockchain profit depends on the efficient development of the partner network. Having focused all efforts in marketing and sales on building this network, **Sharpay** will get a full-fledged closed ecosystem. **Sharpay's**

partner network is platforms, websites, online services, aggregators and applications that have **Sharpay** buttons installed. Organic traffic of a partner network is a natural supplier of **Sharpay** end beneficiaries: platform users who promote content through multisharing.

The proper creation of a partner network will allow the token turnover to reach \$75 million only within the system in the first 3 years of development, or up to \$160 million in case of a wider penetration of the company due to high Token Sale raises.

The following is a list of **Sharpay** potential partners, ranked according to the market share and strategic interest, partly with the market valuation.

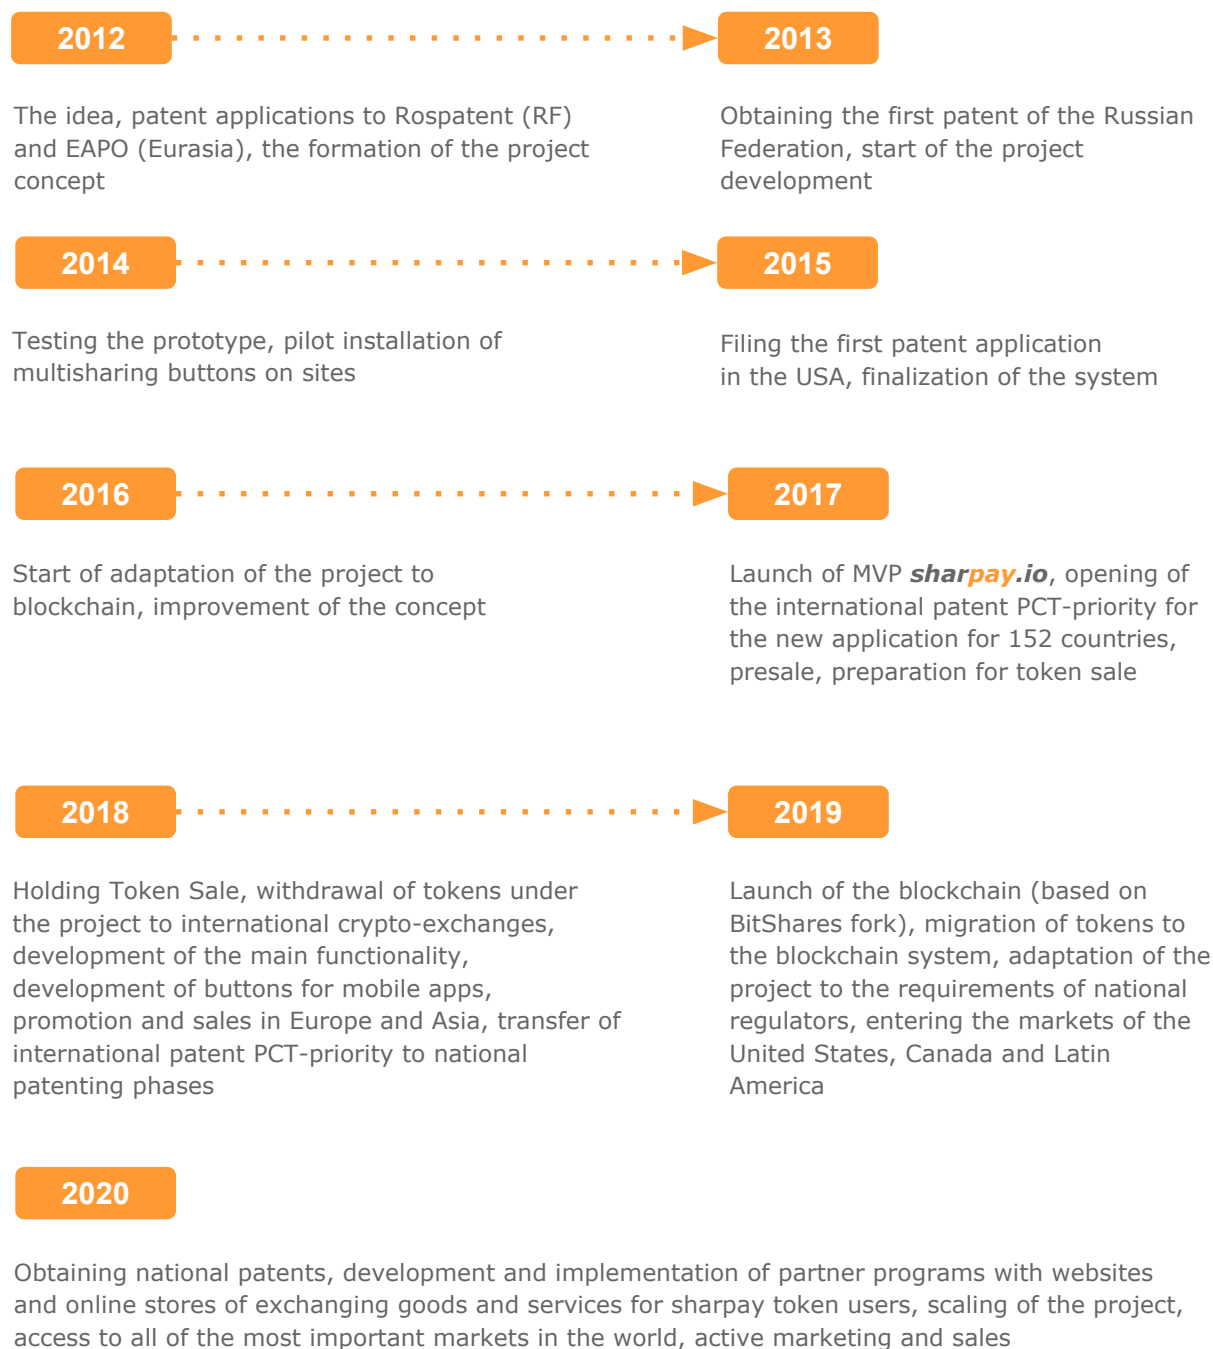

1. Search engines, platform owners and contextual advertising operators: Google, Yandex, Mail, Rambler, Begun and others — the largest market players of all categories of digital marketing services. They set the tone and run the market in general.
2. Social media. To increase revenue through the diversification of advertising services.
3. Online media. Wider coverage in the distribution of news and content. The **Sharpay** team predicts that online media can become the main driver for the growth of the entire **Sharpay** system.
4. Blogging platforms, designers of online stores and websites. To expand and further monetize their services.
5. Aggregators of sharing and posting: market volume of up to 100 companies. They can buy licenses to use **Sharpay**. Old-generation sharing buttons are the potential **profile** strategic partners/investors.
6. Links and likes exchanges, referral operators, operators of loyalty programs, advertising RTB exchanges. They are looking for ways of additional monetization, growth of the client base, and traffic increase.
7. SMM oriented websites. They are looking for new SMM tools; decisions are made based on SMM opinion leaders and trends.
8. Operators of SMM and SEO services: global, regional, freelancers. Always happy to earn more.
9. Operators of social media advertising exchanges. To expand the sphere of influence and earnings.

10. Owners of online services and widgets, e.g. callback services. To drive the communication of the audience with their customers, to move the audience into warm and hot leads.
11. Mobile applications and services. One of the key and fast-growing development areas of the entire digital economy. They are most interested in all the services driving successful communication.

Roadmap

Emission, tokens, Token Sale

To finance the project, the international company Sharpay Inc. plans to issue and sell its own tokens to investors through a transparent Token Sale mechanism (Initial Coin Offering), using a Smart contract. This will allow future holders of **Sharpay** tokens to earn on the growth of the tokens market price at stock exchanges, as well as to get full access to the system's services by pre-purchasing tokens at an early stage of the project development for a notional value with an additional benefit.

In the context of «tokenization» and integration of Sharpay technology with the blockchain, the project is planned to be implemented in two stages:

Stage 1: ETH-based emission of the necessary volume of tokens for free sale, provision of the internal economy of the project, and distribution among users for multisharing and content promotion.

Stage 2: development and launch of the private blockchain, as well as the token migration. To ensure the speed and conditional «simplicity» of the implementation, it is considered to use the possibilities of the BitShares blockchain fork with the POS-basis for the future **Sharpay** blockchain.

The reason to choose BitShares blockchain system is justified by the characteristics of this system, which surpasses the analogs for a number of characteristics:

						
	Bitshares	Bitcoin	Ethereum	Bitcoin Cash	Litecoin	Dash
Median Confirmation Time	~1.5 sec	~10 min	~2 min	~15 min	~3 min	~2 min
Number of Transactions Per Second	3.300	14	10–20	56	56	28
Maximum Number of Transactions Per Day	285 mln	1.2 mln	1.73 mln	4.8 mln	4.8 mln	2.4 mln
Cost Per Transaction	\$0.01	\$2.34	\$0.36	\$0.07	\$0.74	\$0.15
Blockchain Usage (# of operations in one day)	920k SEP-13-2017	370k MAY-14-2017	496k SEP-06-2017	137k AUG-16-2017	44k SEP-01-2017	9.5k AUG-19-2017
Blockchain Length (# of blocks produced to date)	20 mln	490k	4.4 mln	495k	1.3 mln	752k

Source: <https://bitcointalk.org/index.php?topic=1394689.16280>

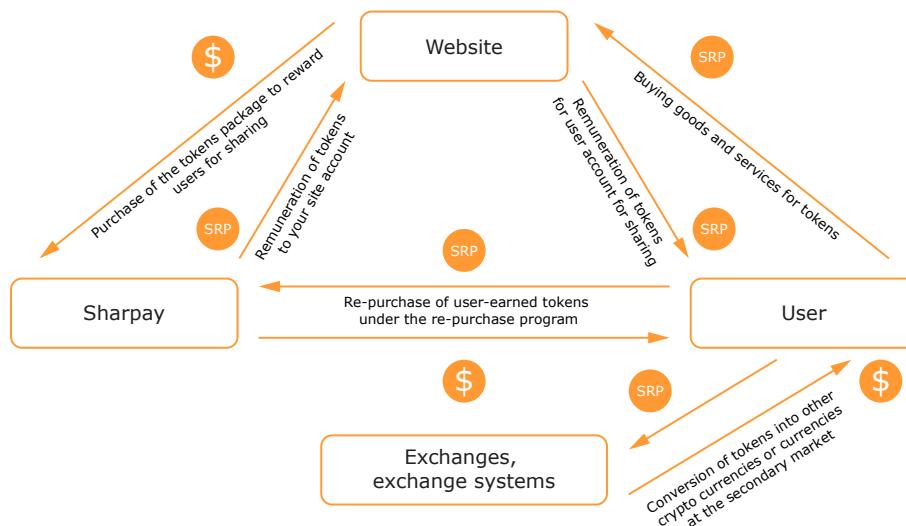

Initially, tokens will be issued on the Ethereum blockchain platform using ERC20 protocol.

Quantity: 4 billion tokens

Additional emission: Not expected.

Sharpay token is the only official means of payment within the system, as well as the basis of an effective business model of using Sharpay's multisharing technology with a payment for sharing.

The scheme of token turnover in the system is as follows:

Distribution of tokens

4 billion tokens = 100%

Tokens designation	Distribution %	Total tokens
Token Sales	37.5	1.5B
System functioning reserve	31.05	1.242B
Bonus for the project team	15	600M
Bounty program	2.5	100M
Advisers remuneration	7	280M
Bonuses for investors at the early stages	6.85	274M
Bonus for investors at the stage of presale when buying a volume of more than 1 400 000 (= \$8900 = 30 ETH) tokens (+ 5% of tokens from the purchased volume of tokens)	0.1	4M
TOTAL:	100	4 billion

Starting price of Sharpay token: 1 Sharpay token = 0.00003 ETH

Free sale of tokens is planned at presale and Token Sale stages.

Presale

Presale period: From December 11, 2017 to February 11, 2018.

Presale plan: \$800,000.

Tokens Presale package volume: About 5% of the total emission.

Presale bonus program

Presale bonus: 50% (**+5% in case of large volume purchases**)

The volume of the bonus tokens for the Presale distribution of the participants: 44 billion tokens.

Thus, with the purchase of 100 **Sharpay** tokens, the participant at the Presale stage actually receives 150 **Sharpay** tokens.

Until December 11, **Sharpay** team are preparing an open release of the main functionality of the system (multisharing and token accrual) and is running a marketing campaign to promote the presale campaign. All funds raised at the Presale stage will be channeled to prepare the Token Sale (mainly for advertisement).

TOKEN SALE

Token Sale period: From March 1 to March 30, 2018, *(it is possible to extend the Token Sale period)*.

The minimum target amount to be raised during the Token Sale is **\$3,000,000**.

Tokens Token Sale package volume: 1.42 billion **Sharpay** tokens (it is possible to increase the Token Sale tokens package from the system functioning reserve).

Distribution scheme of bonus tokens during Token Sale (preliminary):

Bonus, %	Total tokens for sale at a discount, million	Total tokens sold, million	Total tokens including the Token Sale bonus, million	Total tokens for bonuses, million
Token Sale day 1 up to the sale of 100,000,000 tokens with a fixed bonus				
40%	100	100	140	40
Token Sale week 1 up to the sale of 300,000,000 tokens with a fixed bonus				
30%	300	400	390	90
Token Sale week 2 up to the sale of 500,000,000 tokens with a fixed bonus				
20%	500	900	600	100
Token Sale week 3 until the end of Token Sale				
0%	520	1 420	520	–

Tokens not sold during Presale and Token Sale will be transferred to the reserve fund for the further system functioning, immediately after the Token Sale.

After the Token Sale, Sharpay's tokens will be traded at cryptocurrency exchange. This will provide an opportunity for users of the system to purchase it openly by gaining access to the platform products and sell it to the ecosystem participants interested in obtaining this access.

Token price increase strategy

Sharpay tokens are classic user tokens that will be used within the service without any time limit.

Sharpay plans an emission, which will be limited to 4 billion tokens. By using the token within the system, their number at the exchange will gradually decrease.

Due to the free circulation of the token outside the service, its price is unlimited and will be determined by the market based on demand and supply. The **main factors of growth** are the demand and supply at the cryptocurrency exchange, as well as the growth rate of the project itself. The project value will increase due to the increase in the number of users.

The **Sharpay** tokens value will depend on how actively the tokens are used at the platform and its number in the system. The token price may also depend on market conditions and other factors.

Sharpay token price also has a great potential for growth, considering the planned turnover for the third year of the project's development, reaching \$160 million.

The main ways to increase the number of tokens on the market:

- allowing users to earn tokens on the platform through multisharing
- selling tokens from the reserve to companies that use the **Sharpay** button to encourage the customers.

Buyback program

Sharpay plans to allocate 90% of revenue quarterly to ensure the buyback of **Sharpay** tokens from the system users, who receive tokens as compensation for sharing/multisharing. The program starts with the results of Q3 2018.

The buyback price is based on the nominal price of the token and is the amount of 0,00003 ETH. This will provide the financial support for the token price at the exchange, which is not less than the nominal one, and will give grounds for the growth of the token value.

Buyback scheme

1. Quarterly, 90% of the company's revenue goes to the buyback of tokens. Preparations before the start of the buyback procedure take 1 (one) month.
2. **Sharpay** places a Smart contract for the purchase of tokens with a fixed amount and a closing date in 30 (thirty) calendar days.
3. **Sharpay** users are informed of the possibility to sell tokens.
4. The tokens owners send it for sale until they reach the amount covering re-purchase of the number of tokens defined by the Smart contract.
5. One can send and withdraw tokens before the closing date of the Smart contract. After this date, the number of tokens is fixed and all participants receive the payment, in proportion to the number of tokens left on the contract.

Team

Anton Solodikov

CEO

IT entrepreneur, blockchain activist, inventor, author of patent and international patent applications for content promotion and monetization. Previously CEO at Balalike LLP UK (development of content promotion systems) and CMO at a successful Token Sale project GOLOS.io (blockchain and social media).

Igor Karavaev

CBDO

Worked as an Executive Director of the Skolkovo Foundation, a leading Russian business incubator of start-ups, as well as a Chief Strategy and Business Officer of a number of major Russian corporations.

Arkady Yasashny

CFO

Ex-top manager of the largest Russian banks (VTB, MDM, Union), an entrepreneur and investor in high-tech start-ups.

Alexey Stukarchuk

CTO

Blockchain enthusiast, experienced developer of ERP and CRM systems for international companies (including Skoda, Bosch, Ulmart), mobile application developer (iOS, Android), development team leader.

**Valeriy Yushenko**

Software Engineer

High qualified Front-End, Full-Stack, Database & Mobile developer, has working experience in Qualcomm for a long time (Sydney, Australia) and other international companies; now he is totally focused on blockchain technologies

**Ilya Afanasiev**

Support Engineer

Certified specialist in automatic systems of data processing; lives in China, fluently speaks Russian, English & Chinese

**Levi Yau**

Regional Manager (Asia, China, Hong Kong)

Entrepreneur, Web Developer, travel marketplace startup founder in Hong Kong.

**Mark Vdovskikh**

Marketing Manager

Experienced international marketer, expert in strategic planning and creating the efficient communication systems

Katerina Molodova

SMM Manager

Professional in public relations, has strong experience in SMM, content marketing, advertising and event marketing.

Olga Reiner

Community Manager (English, European, Russian)

Cryptoentusiast, philologist, professional interpreter, speaks English, French & Russian

Darya Dreymanis

Community Manager (German, European, Latin)

Specialist in cross culture communications, coordinator of German, European & Spanish communities

Vadim Scherbak

Community Manager (Russia)

Tech evangelist, researcher, innovator, has more than 10 years experience in IT-communications

Intellectual property

Since 2012, the project team has filed multiple patent applications, describing the possibility of multisharing and stimulating the distribution of content tokens, money, points, etc. Currently, the patent technology is covered by the patent priority for the Eurasian international application. There are no existing direct equivalents.

All project intellectual property rights belong to Sharpay Inc.

Legal aspects

The official legal entity of the project is the company Sharpay Inc. Legal address of the company: Suite 101, 1885 Driftwood Bay, Belize City, Belize.

Sharpay Inc. devoted a lot of time and resources to studying the issues of the legal status of tokens and the business model of Sharpay, from the point of view of integration of technologies for multishing and blocking technologies.

The tokens produced by the company are specially designed to support the operation of the Sharpay multicasting system. For this, between users and Sharpay Inc. contracts will be concluded.

Sharpay tokens holders accept all risks of handling tokens Sharpay Inc. to themselves. Tokens can not be returned immediately after purchase. Sharpay Inc. plans to buyback users tokens on the conditions described in the corresponding section of the White Paper.

The purchase of Sharpay tokens is not equated to buying shares in Sharpay Inc. and their holders do not have ownership, control or any other rights in Sharpay Inc.

For the convenience of users, the documents of Sharpay Inc. (White Paper, One Pager), site and other public information about Sharpay Inc. are available in several languages on the site www.sharpay.io, in this case, in the event of a discrepancy, the English version has priority.
